
Safety Assessment of Palm Tree-Derived Ingredients as Used in Cosmetics

Status: Scientific Literature Review for Public Comment
Release Date: January 22, 2019
Panel Date: April 8-9, 2019

All interested persons are provided 60 days from the above date to comment on this safety assessment and to identify additional published data that should be included or provide unpublished data which can be made public and included. Information may be submitted without identifying the source or the trade name of the cosmetic product containing the ingredient. All unpublished data submitted to CIR will be discussed in open meetings, will be available at the CIR office for review by any interested party and may be cited in a peer-reviewed scientific journal. Please submit data, comments, or requests to the CIR Executive Director, Dr. Bart Heldreth.

The 2019 Cosmetic Ingredient Review Expert Panel members are: Chair, Wilma F. Bergfeld, M.D., F.A.C.P.; Donald V. Belsito, M.D.; Ronald A. Hill, Ph.D.; Curtis D. Klaassen, Ph.D.; Daniel C. Liebler, Ph.D.; James G. Marks, Jr., M.D.; Ronald C. Shank, Ph.D.; Thomas J. Slaga, Ph.D.; and Paul W. Snyder, D.V.M., Ph.D. The CIR Executive Director is Bart Heldreth, Ph.D. This report was prepared by Wilbur Johnson, Jr., M.S., Senior Scientific Analyst.

INTRODUCTION

The safety of the following 8 palm tree-derived ingredients, as used in cosmetics, is reviewed in this Cosmetic Ingredient Review (CIR) safety assessment.

Euterpe Edulis Fruit Extract
Euterpe Edulis Juice Extract
Euterpe Oleracea Fruit Extract
Euterpe Oleracea Juice
Euterpe Oleracea Palm Heart Extract
Euterpe Oleracea Pulp Powder
Euterpe Oleracea Seed Powder
Hydrolyzed Euterpe Oleracea Fruit

According to the web-based *International Cosmetic Ingredient Dictionary and Handbook* (wINCI; *Dictionary*), the palm tree-derived ingredients are reported to function mostly as skin conditioning agents in cosmetic products (See Table 1).¹ Euterpe Oleracea Pulp Powder and Euterpe Oleracea Seed Powder also are reported to function as abrasives and exfoliants in cosmetics.

This safety assessment includes relevant published and unpublished data for each endpoint that is evaluated. Published data are identified by conducting an exhaustive search of the world's literature. A list of the typical search engines and websites used, sources explored, and endpoints that CIR evaluates, is available on the CIR website (<https://www.cir-safety.org/supplementaldoc/preliminary-search-engines-and-websites>; <https://www.cir-safety.org/supplementaldoc/cir-report-format-outline>). Unpublished data are provided by the cosmetics industry, as well as by other interested parties.

Botanicals, such as *Euterpe edulis*- or *Euterpe oleracea*-derived ingredients, may contain hundreds of constituents, some of which may have the potential to cause toxic effects. In this assessment, CIR is reviewing the potential toxicity of each of the botanical ingredients as a whole, complex mixture. CIR is not reviewing the potential toxicity of the individual constituents, except wherein such constituents are also ingredients under review.

Given some similarities in composition (based on the available data) between different parts of *Euterpe oleracea*, data on components that are not the names of cosmetic ingredients that are being reviewed in this safety assessment are included. Data on a component of *Euterpe edulis* (*Euterpe edulis* fruit oil) that is not among the names of cosmetic ingredients that are being reviewed are also included.

It is often not known how the substance being tested in a study compares to the cosmetic-grade ingredient. In the report text, if it is known that the material being tested is a cosmetic ingredient, the wINCI naming convention will be used (i.e., the names of cosmetic ingredients are capitalized). If it is not known that the test substance is that same as the cosmetic ingredient, then the taxonomic naming conventions will be used (i.e., with genus and species name italicized).

CHEMISTRY

Definition and General Characterization

The palm species *Euterpe edulis* Martius, popularly known as juçara (or jussara) and açáidosol, is a native tree of the Atlantic Forest (South American forest).² The juçara palm produces a spherical purple fruit. *Euterpe oleracea* Martius (açai), is a native species of tree in the Amazon rainforest.³

The definitions and functions in cosmetics of these ingredients are presented in Table 1.¹

Chemical and Physical Properties

Euterpe Oleracea Fruit Extract

Properties of Euterpe Oleracea Fruit Extract are presented in Table 2.³

Method of Manufacture

Euterpe Oleracea Juice

According to one manufacturer of Euterpe Oleracea Juice, for use in foods, this juice is obtained by cold pressing the thin pulp of the ovoidal fruit (berry) of *Euterpe oleracea* Mart.⁴

Euterpe Oleracea Pulp Powder

In this production method, the fruit pulp obtained from *Euterpe oleracea* fruit harvested in Brazil was frozen. Samples of spray-dried pulp were obtained using an industrial scale spray dryer system and manionic maltodextrin DE10 as a carrier agent.⁵

Composition

Euterpe Edulis Fruit Extract

The composition of Euterpe Edulis Fruit Extract (similarity to raw materials unknown) has been determined using gas chromatography-mass spectrometry and solvents with different polarities (hexane, ethyl acetate, or chloroform) for extraction, and these data are presented in Table 3.⁶

According to research investigating the major anthocyanins (type of flavonoid) and non-anthocyanin phenolic compounds in Euterpe Edulis Fruit Extract, high amounts of anthocyanins, approximately 26 mg/g dry weight basis (dwb), of a total of 31mg/g dwb of phenolic compounds, were detected.⁷ Cyanidin-3-O-rutinoside was the most abundant anthocyanin (73% of the total phenolic compounds content). It should be noted that an analysis of *Euterpe edulis* fruit for phenolics yielded a value of 4087 mg/100 g dwb for soluble phenolics in pulp from fruits collected in southeastern Brazil.⁸ However, a lower value of 1695 mg/100 g dwb for soluble phenolics in this fruit (from Minas Gerais State, a state in the north of Southeastern Brazil) has also been reported.⁹ Furthermore, *Euterpe edulis* fruit is rich in oleic and palmitic fatty acids.²

Additional data on the composition of Euterpe Edulis Fruit Extract, as well as data on the following other components of *Euterpe edulis*/component extracts are presented in Table 4: *Euterpe edulis* fruit, *Euterpe edulis* pulp extract, and *Euterpe edulis* pulp.^{7,10,9,11,12,8,13} Though not cosmetic ingredients, composition data on the 3 are included because they contain chemicals that may also be present in Euterpe Edulis Fruit Extract. Furthermore, data in Table 4 indicate that Euterpe Edulis Fruit Extract and one or more of the 3 fruit parts/extract have constituents in common.

Euterpe Oleracea Fruit Extract

Composition data on Euterpe Oleracea Fruit Extract (various fruit extractants used) relating to phenolic compounds content (anthocyanins included) are presented in Table 5.^{14,15} Additionally, the polyphenol content of Euterpe Oleracea Fruit Extract (powder form) has been expressed as 0.53.¹⁶

It has been reported that total phenolic yields for *Euterpe oleracea* pulp (freeze-dried and mixed with ethyl acetate) ranged from 132.6 to 391.2 mg gallic acid equivalent (GAE)/100 g fresh weight (FW).¹⁷ Also, the total anthocyanin yield ranged from 4.2 to 90.0 mg/100 g FW. Additional data on the composition of Euterpe Oleracea Fruit Extract, as well as data on Euterpe Oleracea Juice, *Euterpe oleracea* pulp, *Euterpe oleracea* fruit, and *Euterpe oleracea* juice extract, are presented in Table 6.^{18,19,20,21,22} Though the latter 2 are not cosmetic ingredients, composition data are included because they contain chemicals that are also present in Euterpe Oleracea Fruit Extract (see Table 5 and Table 6). Data on *Euterpe oleracea* pulp are included because Euterpe Oleracea Pulp Powder is a cosmetic ingredient.

Euterpe Oleracea Seed Powder

In the absence of data on Euterpe Oleracea Seed Powder constituents, composition data on *Euterpe oleracea* seed are presented in Table 7.¹⁵ It should also be noted that when *Euterpe oleracea* seeds were extracted with a solution of 95% ethanol/1.5 N HCL (85:15, v/v), the content of phenolic compounds was reported as a total only (3602 ± 88 mg GAE/100 g (dwb; chemical names not stated), and anthocyanins (content not stated) were among the types of phenolic compounds that were represented in the total.

Impurities

Euterpe Edulis Fruit Extract and Euterpe Edulis Juice Extract

In the absence of impurities data on Euterpe Edulis Fruit Extract and Euterpe Edulis Juice Extract, impurities data on *Euterpe edulis* fruit and *Euterpe edulis* pulp are presented in Table 8.⁹

Euterpe Oleracea Fruit Extract

The heavy metals content of Euterpe Oleracea Fruit Extract (powder) has been described as follows: arsenic (< 0.1 ppm), cadmium (< 0.01 ppm), mercury (< 0.005 ppm), lead (< 0.05 ppm), and copper (0.3 ppm).¹⁶ Impurities data on related *Euterpe oleracea* components (*Euterpe oleracea* fruit and *Euterpe oleracea* pulp) are summarized below.

Euterpe oleracea fruit

Açaí (*Euterpe oleracea* Martius), as a native fruit of the Amazon rainforest, has been described as highly contaminated in microbiological terms.³ The fruit is said to be subject to natural microbiological contamination and one of the main sources of this contamination is water, considering that more than 50% of the municipalities located in the Brazilian Amazon do not use chlorinated water. *Euterpe oleracea* fruit from Brazil and the United States (US) was analyzed for 174 different pesticides, using liquid chromatography-tandem mass spectrometry (LC-MS/MS) and gas chromatography-tandem mass spectrometry (GC-MS/MS).²³ *Euterpe oleracea* fruit that was harvested and lyophilized in Brazil had no detectable pesticides. There also were no detectable pesticides in 7 samples of *Euterpe oleracea* fruit in the US. However, the following pesticides were detected in 5 other samples (identified as samples 1, 4, 8, 9, and 10) of *Euterpe oleracea* fruit in the US: Sample 1 (methoxyfenozide [0.2 ng/g]), Sample 4 (metalaxyl [0.2 ng/g]), Sample 8 (boscalid [2.6 ng/g] and imidacloprid [0.9 ng/g]), Sample 9 (bifenazate [2.5 ng/g], carbendazim [0.9 ng/g]), and Sample 10 (bifenazate [1.6 ng/g], boscalid [3 ng/g], hexythiazox [0.6 ng/g], and pyraclostrobin [0.1 ng/g]).

The following heavy metals have been detected in *Euterpe oleracea* fruit: lead, cadmium, mercury, arsenic, potassium, magnesium, phosphorus, calcium, sodium, zinc, iron, and copper.¹⁹ Ash has been detected in *Euterpe oleracea* fruit in an amount of 1.68 ± 0 g/100 g (dwb).¹⁵

Euterpe oleracea pulp

Ash has been detected in *Euterpe oleracea* pulp in an amount of 3.78 ± 0.06 g/100 g (dwb).¹⁵

Euterpe oleracea seed

In the absence of impurities data on Euterpe Oleracea Seed Powder, there are data indicating that ash has been detected in *Euterpe oleracea* seed in an amount of 1.44 ± 0.01 g/100 g (dwb).¹⁵

USE

Cosmetic

The safety of palm tree-derived ingredients is evaluated based on data received from the US Food and Drug Administration (FDA) and the cosmetics industry on the expected use of these ingredients in cosmetics. Use frequencies of individual ingredients in cosmetics are collected from manufacturers and reported by cosmetic product category in FDA's Voluntary Cosmetic Registration Program (VCRP) database.²⁴ Use concentration data are submitted by the cosmetics industry in response to surveys, conducted by the Personal Care Products Council (Council), of maximum reported use concentrations by product category.²⁵

According to 2018 VCRP data, Euterpe Oleracea Fruit Extract is reported to be used in 352 cosmetic products (238 leave-on products, 110 rinse-off products, 4 products that are diluted for (bath) use).²⁴ Of the palm tree-derived ingredients that are being reviewed in this safety assessment, this is the greatest reported use frequency. The results of a concentration of use survey conducted by the Council in 2017 indicate that Euterpe Oleracea Pulp Powder is being used at maximum use concentrations up to 3% in leave-on products (face and neck products [not spray]) and maximum use concentrations up to 0.6% in rinse-off products (moisturizing products [not spray] and paste masks [mud packs]).²⁵ These are the highest use concentrations in leave-on and rinse-off products that are being reported for the palm tree-derived ingredients that are being reviewed in this safety assessment. Further use data are presented in Table 9.

According to VCRP and Council survey data, the following 4 ingredients that are being reviewed are not being used in cosmetic products: Euterpe Edulis Fruit Extract, Euterpe Edulis Juice Extract, Euterpe Oleracea Seed Powder, and Hydrolyzed Euterpe Oleracea Fruit.

Cosmetic products containing palm tree-derived ingredients may be applied to the skin or, incidentally, may come in contact with the eyes (e.g., Euterpe Oleracea Fruit Extract). Euterpe Oleracea Fruit Extract, Euterpe Oleracea Juice, Euterpe Oleracea Palm Heart Extract, and Euterpe Oleracea Pulp powder are ingredients that are used in products that come in contact with mucous membranes during product use (ingredient use concentrations: 0.0000083-0.3%). Additionally, Euterpe Oleracea Fruit Extract and Euterpe Oleracea Pulp Powder could be incidentally ingested (at maximum use concentrations up to 0.025% [lipstick] and 0.3% [lipstick], respectively). Products containing palm tree-derived ingredients may be applied as frequently as several times per day and may come in contact with the skin for variable periods following application. Daily or occasional use may extend over many years.

The following palm tree-derived ingredients are being used in products that are sprayed: Euterpe Oleracea Fruit Extract (0.001% in pump hair spray), Euterpe Oleracea Palm Heart Extract (0.001% in colognes and toilet waters), and Euterpe Oleracea Pulp Powder (0.015% in colognes and toilet waters). In practice, 95% to 99% of the droplets/particles released from cosmetic sprays have aerodynamic equivalent diameters $> 10 \mu\text{m}$, with propellant sprays yielding a greater fraction of droplets/particles below $10 \mu\text{m}$, compared with pump sprays.^{26,27,28,29} Therefore, most droplets/particles incidentally inhaled from cosmetic sprays would be deposited in the nasopharyngeal and bronchial regions and would not be respirable (i.e., they would not enter the lungs) to any appreciable amount.^{26,27} The only use of palm tree-derived ingredients in powders is being reported for Euterpe Oleracea Juice, which is being used at concentrations up to 0.01% in face powders. Conservative estimates of inhalation exposures to respirable particles during the use of loose powder cosmetic products are 400-fold to 1000-fold less than protective regulatory and guidance limits for inert airborne respirable particles in the workplace.^{30,31,32}

The palm tree-derived ingredients reviewed in this safety assessment are not included on the European Union's list of substances that are restricted or list of substances that are prohibited in cosmetic products.³³

Non-Cosmetic

Euterpe Oleracea Fruit Extract

The Flavor and Extract Manufacturers Association (FEMA) has listed acai berry extract (*Euterpe oleracea* extract) as a generally recognized as safe (GRAS) food flavoring ingredient.³⁴ According to the *Dictionary*, acai berry extract (a Euterpe Oleracea Fruit Extract tradename mixture) is composed of Euterpe Oleracea Fruit Extract, propylene glycol, and water.¹ *Euterpe oleracea* is cultivated for both its fruit and edible hearts of palm; it should be noted that acai berry juice (GRAS ingredient) and hearts of palm are derived from the same species.³⁵

TOXICOKINETIC STUDIES

Dermal Penetration

Data on the dermal penetration of the palm tree-derived ingredients reviewed in this safety assessment were neither found in the published literature, nor were these data submitted. Dermal penetration data were not expected to be found because each botanical ingredient is a mixture of hundreds of constituents.

Absorption, Distribution, Metabolism, and Excretion

Human

Oral

Euterpe Oleracea Juice and *Euterpe oleracea* pulp

An acute 4-way crossover clinical trial that involved oral dosing with the following was performed using 12 subjects: Euterpe Oleracea Juice, *Euterpe oleracea* pulp, applesauce sauce (control), and a non-antioxidant beverage (control).³⁶ An oral dose of Euterpe Oleracea Juice or *Euterpe oleracea* pulp (7 mL/kg) was administered after a washout phase and overnight fast, and plasma was repeatedly sampled over 12 h. Urine was sampled over a 24-h period after dosing. Plasma anthocyanin (antioxidant) concentrations were determined over a period of 0 - 12 h. Noncompartmental pharmacokinetic analysis of total anthocyanins, quantified as cyanidin-3-*O*-glucoside, indicated maximum plasma

concentration (C_{\max}) values of 2321 and 1138 ng/L at maximum concentration times (t_{\max}) of 2.2 and 2.0 h, and area under the concentration-time curve (AUC_{last} ; last refers to AUC up to the last measurable concentration) values of 8568 and 3314 ng h/L for *Euterpe oleracea* pulp and Euterpe Oleracea Juice, respectively. Nonlinear mixed effect modeling identified dose volume as a significant predictor of relative oral bioavailability in a negative nonlinear relationship for *Euterpe oleracea* pulp and Euterpe Oleracea Juice. Additionally, after consumption of *Euterpe oleracea* pulp and applesauce, plasma antioxidant capacity was significantly increased. Individual increases in plasma antioxidant capacity of up to 2.3- and 3-fold for Euterpe Oleracea Juice and *Euterpe oleracea* pulp, respectively, were observed. The antioxidant capacity in the urine, generation of reactive oxygen species, and uric acid concentrations in plasma were not significantly altered by the treatments. The results of this study indicate that anthocyanins from *Euterpe oleracea* are bioavailable in human subjects after consumption of Euterpe Oleracea Juice and *Euterpe oleracea* pulp in moderate amounts.

TOXICOLOGICAL STUDIES

Acute Toxicity Studies

Oral

***Euterpe oleracea* pulp-enriched fruit and berry juice**

The acute toxicity of an *Euterpe oleracea* pulp-enriched fruit and berry juice (fortified with glucosamine) was evaluated in accordance with Organization for Economic Co-operation and Development (OECD) test guideline (TG) 423.³⁷ The concentration of *Euterpe oleracea* pulp in the juice was not stated. Two groups of Wistar rats (CrI:(WI) BR strain; 5 males and 5 females per group) received single oral doses by gavage of 5 g/kg and 20 g/kg, respectively. Dosing was followed by a 14-day observation period and gross necropsy was performed on day 15. None of the animals died and there were no treatment-related clinical or behavioral signs. For female rats, the mean body weight gain (on days 1 and 2 and during the last week) in the 20 g/kg dose group was statistically significantly lower when compared to the 5 g/kg group. However, the total body weight gain of females in the 20 g/kg dose group was not statistically significantly different when compared to the 5 g/kg dose group. At necropsy (both dose groups) on day 15, there was no evidence of gross lesions in any organ, and all organs were free of gross pathological changes. It was concluded that the acute oral LD₅₀ for the test substance was > 20 g/kg.

Short-Term Toxicity Studies

Oral

***Euterpe oleracea* fruit oil**

The short-term oral toxicity of *Euterpe oleracea* fruit oil was evaluated using groups of 6 Wistar rats.³⁸ *Euterpe oleracea* fruit oil (doses of 30 mg/kg, 100 mg/kg, or 300 mg/kg) in 1% Tween 80 was administered by gavage daily (at 24-h intervals) for 14 consecutive days. At the dose of 300 mg/kg, but not at lower doses, some animals began to display signs of toxicity such as diarrhea and bristling of the hair

Subchronic Toxicity Studies

Euterpe Oleracea Fruit Extract

In a 16-week-tumorigenicity study involving 20 Wistar rats dosed orally with Euterpe Oleracea Fruit Extract (hydroalcoholic extract) and subcutaneously (s.c.) with 7,12-dimethylbenz[a]anthracene (DMBA), there was no evidence of toxicity of the extract, based on food consumption, body weight, and activity levels, when compared to results for the 20 control rats.³⁹ Histopathological results for the liver and kidneys indicated a protective effect of Euterpe Oleracea Fruit Extract, because, in the control group, there was an increase in fibrosis, atypical cells, and hemorrhagic microenvironment. There were no morphological differences in heart tissue between test and control rats. Additional study results are included in the section on Anti-Carcinogenicity.

***Euterpe oleracea* pulp-enriched fruit and berry juice**

The subchronic oral toxicity of *Euterpe oleracea* pulp-enriched fruit and berry juice (fortified with glucosamine) was evaluated using groups of 40 Wistar rats (SPF Hsd.Brl.Han strain; 20 males and 20 females per group).³⁷ The test substance was administered daily by gavage for 90 days to 3 groups at doses of 10, 20, and 40 g/kg, respectively. Necropsy was performed on day 91. The vehicle control group was dosed with saline, and there was also an untreated control group. When compared to the control groups, there were no treatment-related, statistically significant changes in the following in

surviving animals of all 3 dose groups: body weight, food and water consumption, ophthalmology, organ weights, urinalysis, hematological and clinical chemistry, or gross pathology. Three animals died during the study (1 male at 20 g/kg; 1 male at 40 g/kg; and 1 female at 10 g/kg). The animals that died did not have clinical symptoms prior to death. With the exception of signs of suffocation/aspiration congestion (due to problems with the gavage administration of the test substance; not considered test substance-related), there was no evidence of histopathological lesions or injury to tissues or organs. The only statistically significant difference observed was in mean adrenal weight relative to the brain weight in untreated female controls, when compared to the 20 mg/kg dose group. However, this statistically significant difference was not biologically significant. The no-observed-adverse-effect-level (NOAEL) was determined to be 40 g/kg/day for male and female rats.

DEVELOPMENTAL AND REPRODUCTIVE TOXICITY STUDIES

Data on the developmental and reproductive toxicity of palm tree-derived ingredients reviewed in this safety assessment were neither found in the published literature, nor were these data submitted.

GENOTOXICITY STUDIES

The following genotoxicity data on palm tree-derived ingredients are summarized in Table 10.

In Vitro

Euterpe edulis fruit pulp (9% in water) was genotoxic in one *Salmonella typhimurium* strain in the Ames test, and in the micronucleus assay (RAW264.7 mouse macrophage-like cells).⁶ *Euterpe edulis* fruit oil was non-genotoxic in the cytokinesis-block micronucleus assay (human peripheral blood lymphocytes and HepG2 human hepatoma cells) and in the comet assay (human peripheral blood lymphocytes and HepG2 human hepatoma cells).⁴⁰

Euterpe oleracea pulp-enriched fruit and berry juice (fortified with glucosamine) was non-genotoxic in the Ames test (*S. typhimurium* strains), the chromosomal aberration assay (Chinese hamster lung cells), and in the L5178Y/TK+/- mouse lymphoma assay.³⁷

In Vivo

Euterpe edulis fruit pulp (9% in water) was genotoxic in the micronucleus assay (bone marrow erythrocytes from dosed rats).⁶ *Euterpe edulis* fruit pulp (9% in water) was non-genotoxic in the micronucleus assay (peripheral blood lymphocytes from dosed rats), in the comet assay (single cell gel electrophoresis [SCGE] test) involving randomly selected cells in blood from dosed rats, and in another comet assay involving randomly selected cells in human blood that was drawn after dosing.

Euterpe oleracea pulp-enriched fruit and berry juice (fortified with glucosamine) was non-genotoxic in the micronucleus assay (mouse bone marrow erythrocytes from dosed mice).³⁷ *Euterpe oleracea* fruit pulp was non-genotoxic in the micronucleus assay (mouse bone marrow erythrocytes and peripheral blood erythrocytes from dosed mice), and was non-genotoxic in the comet assay involving mouse peripheral blood erythrocytes, liver cells, and kidney cells from dosed mice.⁴¹ In rats dosed with *Euterpe oleracea* fruit oil, there was no significant induction of DNA strand breaks in the comet assay (peripheral blood, bone marrow, liver cells, and testicle cells), but there was minor DNA damage in a few nucleoids.³⁸ *Euterpe oleracea* fruit oil was non-genotoxic in the micronucleus assay (bone marrow erythrocytes from dosed rats).

CARCINOGENICITY STUDIES

Data on the carcinogenicity of palm tree-derived ingredients reviewed in this safety assessment were neither found in the published literature, nor were these data submitted.

ANTI-CARCINOGENICITY STUDIES

Euterpe Oleracea Fruit Extract

The anti-tumorigenicity of Euterpe Oleracea Fruit Extract (hydroalcoholic extract) was evaluated using 2 groups of 40 female Wistar rats.³⁹ Twenty rats were dosed orally (200 mg/kg, by gastric intubation) with a saline solution of the fruit extract for 16 consecutive weeks. The control group (20 rats) was dosed with saline according to the same procedure. One day after initiation of treatment with Euterpe Oleracea Fruit Extract, mammary carcinogenesis was induced in all animals by

s.c. injection of 25 mg/kg of DMBA in the mammary gland. The animals were palpated in the mammary gland once per week to detect the presence of breast tumors. At the end of the treatment period, the animals were killed and tumor tissues as well as heart, liver, and kidney samples were examined histologically. Survival analysis indicated that *Euterpe Oleracea* Fruit Extract increased survival ($P = 0.0002$, long-rank test) and reduced the number of deaths ($P = 0.0036$, Chi-square test). Cumulative survival periods of 15.15 weeks and 12.75 weeks were reported for test and control animals, respectively. The mortality rate in the control group was 65% (13 deaths), and the mortality rate was 15% (3 deaths) after dosing with *Euterpe Oleracea* Fruit Extract.

In the control group, the tumor incidence rate was 100%. However, in the group dosed with *Euterpe Oleracea* Fruit Extract, the tumor incidence rate was markedly reduced to 50%. In both groups, mammary tumors displayed adhesions and a cystic pattern near the site of tumor induction. However, there was no significant difference in tumor volume (control: 4.151 ± 0.8 mL; *Euterpe Oleracea* Fruit Extract: 3.971 ± 1.3 mL) and tumor weight (control: 3.012 ± 0.5 g; *Euterpe Oleracea* Fruit Extract: 2.52 ± 0.7 g). It was concluded that *Euterpe Oleracea* Fruit Extract (hydroalcoholic extract) exhibited anti-tumorigenic activity in DMBA-induced breast cancer.³⁹

Euterpe Oleracea Pulp Powder

A study was performed to investigate the protective effect of *Euterpe Oleracea* Pulp Powder (spray-dried) intake on colon carcinogenesis induced by 1,2-dimethylhydrazine.⁴² Four groups of 10 rats received 4 (s.c.) injections of 1,2-dimethylhydrazine (40 mg/kg) for 4 weeks (twice a week), for initiation of colon carcinogenesis. A fifth group (5 rats) received similar injections of ethylenediaminetetraacetic acid (EDTA, 1,2-dimethylhydrazine vehicle). The groups were then fed a standard diet containing 2.5% or 5.0% *Euterpe Oleracea* Pulp Powder, or a diet containing 0.2% N-acetylcysteine (antioxidant and anti-carcinogenic agent) for 10 weeks, using aberrant crypt foci as the endpoint. Additionally, two groups were fed a standard diet or a diet containing 5.0% *Euterpe Oleracea* Pulp Powder for 20 weeks, using colon tumors as the endpoint. In the assay using aberrant crypt foci as the endpoint, a reduction in the number of aberrant crypts and aberrant crypt foci were observed in the groups fed 5.0% *Euterpe Oleracea* Pulp Powder (37% aberrant crypts and 47% aberrant crypt foci inhibition, $p = 0.036$) and 0.2% N-acetylcysteine (39% aberrant crypts and 41% aberrant crypt foci inhibition, $p = 0.042$). In the assay using colon tumors as the endpoint, a reduction in the number of invasive tumors ($p < 0.005$) and tumor multiplicity ($p = 0.001$) was observed in the group fed with 5.0% *Euterpe Oleracea* Pulp Powder. Also, a reduction in tumor Ki-67 (human protein strictly associated with cell proliferation) cell proliferation ($p = 0.003$) and net growth index ($p = 0.001$) was observed in the group fed 5.0% *Euterpe Oleracea* Pulp Powder. It was concluded that the results of this study indicate that *Euterpe Oleracea* Pulp Powder feeding may reduce the development of chemically-induced rat colon carcinogenesis.

Another study was performed to evaluate whether feeding with *Euterpe Oleracea* Pulp Powder attenuates the initiation step of chemically-induced mouse colon carcinogenesis.⁵ *Euterpe oleracea* fruit pulp was frozen and samples of spray-dried pulp (powder) were obtained. The production method for this powder is stated in the Method of Manufacture section of this report. This study involved male Swiss mice (3 groups of 15 (Groups 1 - 3); 1 group of 5 (Group 4)). Group 1 was fed a low fat diet and Groups 2 and 3 were fed a low fat diet containing 2.5% and 5% *Euterpe Oleracea* Pulp Powder, respectively, during weeks 1 to 4. The positive control group (Group 4) was fed a low fat diet containing 0.1% indole-3-carbinol during weeks 1 to 3. All groups received an intraperitoneal (i.p.) injection of the colon carcinogen azoxymethane (AOM) at week 3. Some mice from groups 1 to 3 and all mice from group 4 ($n = 5$ mice per group) were killed at week 3 ($n = 5$ mice/group) and liver samples were collected for immunohistochemical and glutathione analysis. Other mice (Groups 1-3; $n = 10$ mice/group) received a second i.p. injection of AOM at week 4 and were fed a high-fat diet to accelerate the development of preneoplastic aberrant crypt foci (ACF) until week 14. At week 3, both dietary *Euterpe Oleracea* Pulp Powder doses (2.5% or 5.0%) reduced ($p < 0.001$) peripheral blood cell DNA damage induced by AOM. Also, 5.0% *Euterpe Oleracea* Pulp Powder increased ($p = 0.002$) hepatic total glutathione. At week 14, 5.0% *Euterpe Oleracea* Pulp Powder reduced ($p < 0.05$) ACF multiplicity. These findings indicate that feeding with *Euterpe Oleracea* Pulp Powder attenuates chemically-induced mouse colon carcinogenesis by increasing total GSH and attenuating DNA damage and preneoplastic lesion development.

OTHER RELEVANT STUDIES

Effect on Mast Cell Activation

***Euterpe oleracea* pulp**

The pretreatment of IgE-sensitized mouse primary cultured mast cells with *Euterpe oleracea* pulp caused dramatic suppression of antigen-induced degranulation in a dose-dependent manner (1 to 1000 ng/ml).⁴³ Furthermore, *Euterpe*

oleracea pulp suppressed IgE-mediated degranulation and transcription of the cytokine genes from a cultured mast cell line of rat basophilic leukemia (RBL)-2H3 cells. The results also suggest that *Euterpe oleracea* pulp could selectively inhibit FcεRI (high affinity IgE receptor) signaling pathways, and indicate that the FcεRI-mediated complementary signaling pathway was suppressed by *Euterpe oleracea* pulp. The authors noted that these results demonstrate that *Euterpe oleracea* Pulp is a potent inhibitor of IgE-mediated mast cell activation.

Cytotoxicity

Euterpe Oleracea Fruit Extract

The anti-carcinogenicity of Euterpe Oleracea Fruit Extract (hydroalcoholic extract) was evaluated in a study using cell viability as the toxicity endpoint.⁴⁴ The malignant cell lines derived from human mammary adenocarcinoma (MCF-7 and MDA-MB-468 cells) and human colon adenocarcinomas (Caco-2 and HT-29) were treated with 10, 20, and 40 µg/ml Euterpe Oleracea Fruit Extract for 24 h and 48 h. After treatment, cell viability was measured using 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) assays, and cell morphological features were observed by light and transmission electron microscopy. The data were analyzed statistically. Of all the cell lines tested, MCF-7 was the only line that responded to Euterpe Oleracea Fruit Extract treatment (cytotoxic effect). Significant reduction ($p < 0.01$) in cell viability and altered cell morphological features (by inducing the appearance of autophagic vacuoles) was noted at all concentrations. It was concluded that Euterpe Oleracea Fruit Extract possesses anti-tumorigenic potential in the MCF-7 cell line.

Euterpe oleracea pulp extract

The antiproliferative activity of *Euterpe oleracea* pulp extract (polyphenolic extract, concentrations ranging from 0.04 to 12 µg of gallic acid equivalents (GAE)/mL) was evaluated in a cell culture model using HT-29 colon carcinoma cell viability as the endpoint.⁴⁵ Cell numbers were determined after 48 h of incubation. Total cell numbers were indicative of the proliferative activity of HT-29 cells and the cytotoxic effect of *Euterpe oleracea* pulp extract. The extract caused significant ($p < 0.01$) decreases in total cell numbers in a concentration-dependent manner.

DERMAL IRRITATION AND SENSITIZATION STUDIES

Dermal irritation and sensitization data on the palm tree-derived ingredients reviewed in this safety assessment were neither found in the published literature, nor were these data submitted.

SUMMARY

The safety of 8 palm tree-derived ingredients as used in cosmetics is reviewed in this CIR safety assessment. According to the *Dictionary*, these ingredients function mostly as skin conditioning agents in cosmetic products. Euterpe Oleracea Pulp Powder and Euterpe Oleracea Seed Powder also function as abrasives and exfoliants in cosmetics.

According to 2018 VCRP data, Euterpe Oleracea Fruit Extract is reported to be used in 352 cosmetic products (238 leave-on products, 110 rinse-off products, 4 products that are diluted for (bath) use). Of the palm tree-derived ingredients that are being reviewed in this safety assessment, this is the greatest reported use frequency. The results of a concentration of use survey conducted by the Council in 2017 indicate that Euterpe Oleracea Pulp Powder is being used at maximum use concentrations up to 3% in leave-on products (face and neck products [not spray]) and maximum use concentrations up to 0.6% in rinse-off products (moisturizing products [not spray] and paste masks [mud packs]). These are the highest use concentrations in leave-on and rinse-off products that are being reported for the palm tree-derived ingredients that are being reviewed in this safety assessment. According to VCRP and Council survey data, the following 4 ingredients that are being reviewed are not being used in cosmetic products: Euterpe Edulis Fruit Extract, Euterpe Edulis Juice Extract, Euterpe Oleracea Seed Powder, and Hydrolyzed Euterpe Oleracea Fruit.

The results from a clinical trial involving 12 subjects who consumed an oral dose (7 ml/kg) of Euterpe Oleracea Juice or *Euterpe oleracea* pulp indicated that anthocyanins from *Euterpe oleracea* are bioavailable in human subjects after consumption of Euterpe Oleracea Juice and *Euterpe oleracea* pulp in moderate amounts.

The acute toxicity of an *Euterpe oleracea* pulp-enriched fruit and berry juice (fortified with glucosamine) was evaluated using 2 groups of 10 Wistar rats that received single oral doses of 5 g/kg and 20 g/kg, respectively. None of the animals died and there were no treatment-related clinical or behavioral signs. At necropsy, there was no evidence of gross pathological changes in organs examined, and the acute oral LD₅₀ was reported as > 20 g/kg.

In groups of 6 Wistar rats, *Euterpe oleracea* fruit oil (doses of 30 mg/kg, 100 mg/kg, or 300 mg/kg) in 1% Tween 80 was administered by gavage daily for 14 consecutive days. At the dose of 300 mg/kg, but not at lower doses, some of the animals had signs of toxicity such as diarrhea and bristling of the hair. In a 16-week study involving 20 Wistar rats dosed orally with Euterpe Oleracea Fruit Extract and s.c. with DMBA, there was no evidence of toxicity of the extract, based on food consumption, body weight, and activity levels. There were no morphological differences in heart tissue between test and control rats.

The subchronic oral toxicity of *Euterpe oleracea* pulp-enriched fruit and berry juice (fortified with glucosamine) was evaluated using groups of 40 Wistar rats. The test substance was administered daily for 90 days to 3 groups at oral doses of 10, 20, and 40 g/kg, respectively. There were no treatment-related, statistically significant changes in the following in surviving animals of all 3 dose groups: body weight, food and water consumption, ophthalmology, organ weights, urinalysis, hematological and clinical chemistry, or gross pathology. The 3 animals that died during the study did not have clinical symptoms prior to death, and there was no evidence of histopathological lesions or injury to tissues or organs. An NOAEL of 40 g/kg/day was reported.

Components of *Euterpe edulis* and *Euterpe oleracea* were evaluated in in vitro genotoxicity tests. *Euterpe edulis* fruit pulp (9% in water) was genotoxic in one *S. typhimurium* strain in the Ames test, and in the micronucleus assay. *Euterpe edulis* fruit oil was non-genotoxic in the cytokinesis-block micronucleus assay and in the comet assay. *Euterpe oleracea* pulp enriched fruit and berry juice (fortified with glucosamine) was non-genotoxic in the Ames test, the chromosomal aberration assay, and in the L5178Y/TK+/- mouse lymphoma assay.

In vivo genotoxicity test results for components of *Euterpe edulis* and *Euterpe oleracea* have also been reported. *Euterpe edulis* fruit pulp (9% in water) was genotoxic in one micronucleus assay, but was non-genotoxic in another micronucleus assay and in comet assays. *Euterpe oleracea* pulp-enriched fruit and berry juice (fortified with glucosamine) was non-genotoxic in the micronucleus assay. *Euterpe oleracea* fruit pulp was non-genotoxic in the micronucleus assay and in the comet assay. Results for *Euterpe oleracea* fruit oil in the comet assay indicated no significant induction of DNA strand breaks, but there was minor DNA damage in a few nucleoids. *Euterpe oleracea* fruit oil was also non-genotoxic in the micronucleus assay.

The anti-tumorigenicity of Euterpe Oleracea Fruit Extract has been demonstrated both in vivo (rats, breast cancer study) and in vitro (human mammary adenocarcinoma cell line). In vivo anti-carcinogenic activity of Euterpe Oleracea Pulp Powder has been demonstrated in colon cancer studies involving rats. In another study, the antiproliferative activity of *Euterpe oleracea* pulp extract was evaluated in a cell culture model using colon carcinoma cells, and a significant decrease in total cell numbers was reported.

In an in vitro study in which IgE-sensitized mouse mast cells were treated with *Euterpe oleracea* pulp, the test material was found to be a potent inhibitor of IgE-mediated mast cell activation.

INFORMATION SOUGHT

The following data are requested for the palm tree-derived cosmetic ingredients reviewed in this safety assessment:

- 1) Method of manufacture data
- 2) Chemical characterization data
- 3) Dermal toxicity data
- 4) Human skin irritation and sensitization data at maximum reported concentrations of use
- 5) Any additional data that would inform this safety assessment

TABLES

Table 1. Definitions, idealized structures, and functions of the ingredients in this safety assessment. ^(1: CIR Staff)

Ingredient CAS No.	Definition & Structures	Function(s)
Euterpe Edulis Fruit Extract	Euterpe Edulis Fruit Extract is the extract of the fruit of <i>Euterpe edulis</i> .	Skin-Conditioning Agents - Miscellaneous
Euterpe Edulis Juice Extract	Euterpe Edulis Juice Extract is the extract of the sap of <i>Euterpe edulis</i> .	Skin-Conditioning Agents - Miscellaneous
Euterpe Oleracea Fruit Extract 879496-95-4 (generic) 906351-38-0 (generic)	Euterpe Oleracea Fruit Extract is the extract of the fruit of <i>Euterpe oleracea</i> .	Hair Conditioning Agents
Euterpe Oleracea Juice 879496-95-4 (generic) 906351-38-0 (generic)	Euterpe Oleracea Juice is the juice expressed from the fruit of <i>Euterpe oleracea</i> .	Skin-Conditioning Agents - Miscellaneous
Euterpe Oleracea Palm Heart Extract 879496-95-4 (generic) 906351-38-0 (generic)	Euterpe Oleracea Palm Heart Extract is the extract of the palm heart of <i>Euterpe oleracea</i> .	Skin-Conditioning Agents - Emollient
Euterpe Oleracea Pulp Powder 879496-95-4 (generic) 906351-38-0 (generic)	Euterpe Oleracea Pulp Powder is the powder obtained from the dried, ground pulp of <i>Euterpe oleracea</i> .	Abrasives; Antioxidants; Exfoliants; Skin-Conditioning Agents - Miscellaneous
Euterpe Oleracea Seed Powder 879496-95-4 906351-38-0	Euterpe Oleracea Seed Powder is the powder obtained from the dried, ground seeds of <i>Euterpe oleracea</i> .	Abrasives; Exfoliants
Hydrolyzed Euterpe Oleracea Fruit	Hydrolyzed Euterpe Oleracea Fruit is the hydrolysate of the fruit of <i>Euterpe oleraceae</i> derived by acid, enzyme or other method of hydrolysis.	Skin-Conditioning Agents - Miscellaneous

Table 2. Chemical and Physical Properties of Palm Tree-Derived Ingredients

Property	Value/Results	Reference
Euterpe Oleracea Fruit Extract		
Form	thin hygroscopic powder	3
Volume density (g/L)	487.79	3
Solubility	Soluble in water	3

Components	<i>Euterpe oleracea</i> fruit	<i>Euterpe oleracea</i> fruit powder extract	<i>Euterpe oleracea</i> juice extract	<i>Euterpe Oleracea</i> Juice (data on the pulp [contains juice] identified as pulp below)
<u>Lignans</u>				
(-)-(7R,8S)-dihydrodehydroconiferyl alcohol	Amount not stated			
erythro-1-(4-hydroxy-3-methoxyphenyl)-2-[4-(3-hydroxypropyl)-2-methoxy-phenoxy]-1,3-propanediol	Amount not stated			
(+)-isolariciresinol	Amount not stated			
(+)-(6R,7S,8S)-isolariciresinol	Amount not stated			
(+)-lariciresinol (8)	Amount not stated			
(+)-(7S,8R,8'R)-lariciresinol	Amount not stated			
(+)-(7R,8S)-5-methoxydihydrodehydroconiferyl alcohol	Amount not stated			
(+)-5-methoxy-isolariciresinol	Amount not stated			
(+)-(6R,7S,8S)-5-methoxyisolariciresinol	Amount not stated			
(+)-pinoresinol	Amount not stated			
(+)-syringaresinol	Amount not stated			
threo-1-(4-Hydroxy-3-methoxyphenyl)-2-[4-(3-hydroxypropyl)-2-methoxyphenoxy]-1,3-propanediol	Amount not stated			
<u>Neolignan glucosides</u>				
(-)-(7R,8S)-7',8'-dihydroxy-dihydrodehydroconiferyl alcohol-9-O-β-D-glucopyranoside		Amount not stated		
(+)-(7S,8R)-7',8'-dihydroxy-dihydrodehydroconiferyl alcohol-9-O-β-D-glucopyranoside		Amount not stated		
4-hydroxy-2-methoxyphenyl 1-O-[6-(hydrogen 3-hydroxy-3-methylpentanedioate)]-β-D-glucopyranoside		Amount not stated		
<u>Carotenoids</u>				
α-carotene	Amount not stated			
β-carotene	Amount not stated			
chlorophyll	Amount not stated			
lutein	Amount not stated			
tocopherols A, B, C, and D	Amount not stated			
<u>Vitamins</u>				
vitamin A	Amount not stated			
vitamin B1	Amount not stated			
vitamin B2	Amount not stated			
vitamin B3	Amount not stated			
vitamin B5	Amount not stated			
vitamin C	Amount not stated			
vitamin E	Amount not stated			
vitamin K	Amount not stated			

Table 7. Composition data on *Euterpe oleracea* Seed.¹⁵

Components	Amount (g/100 g [wwb])
Moisture	38.57 ± 0.07
Protein	3.95 ± 0.03
Lipid	1.04 ± 0.03
Carbohydrates	55.55

NR = Not Reported; Totals = Rinse-off + Leave-on + Diluted for Use Product Uses

^aIt is possible that these products may be sprays, but it is not specified whether the reported uses are sprays*

^bIt is possible that these products may be powders, but it is not specified whether the reported uses are powders

Note: Because each ingredient may be used in cosmetics with multiple exposure types, the sum of all exposure type uses may not equal the sum of total uses.

Table 10. Genotoxicity Studies on Palm Tree-derived ingredients and Related Components of *Euterpe edulis* and *Euterpe oleracea*.

Ingredient	Strain/cell type	Assay	Dose/Concentration	Results
<i>In Vitro</i>				
<i>Euterpe edulis</i> fruit pulp (9% in water)	<i>Salmonella typhimurium</i> strains: TA97, TA98, TA100, and TA102	Ames test, with and without metabolic activation.	Doses up to 500 µg/plate	Genotoxic in strain TA97 at doses ranging from 25 to 250 µg/plate without metabolic activation. Clear trend for genotoxicity in strains TA98 and TA100 at doses ranging from 25 to 250 µg/plate without metabolic activation. ⁶
<i>Euterpe edulis</i> fruit pulp (9% in water)	RAW264.7 cells (mouse macrophage-like cells).	Micronucleus assay	Concentrations of 0.027, 0.108, 0.27, 0.54, and 1.08 mg per plate (0.27, 1.08, 2.7, 5.4, and 10.8 mg/ml, respectively)	Cytotoxic effect, suggested by a decrease in the mitotic index and survival rates, observed at all concentrations. When compared to negative control (sodium chloride), genotoxicity was significantly higher at all doses tested. ⁶
<i>Euterpe edulis</i> fruit oil	Human peripheral blood lymphocytes and HepG2 (human hepatoma) cell line	Cytokinesis-block micronucleus assay	Concentrations up to 1000 µg/ml	Absence of significant DNA and chromosome damage in human lymphocytes and HepG2 cells. ⁴⁰
<i>Euterpe edulis</i> fruit oil	Human peripheral blood lymphocytes and HepG2 (human hepatoma) cell line	Comet assay	Concentrations up to 1000 µg/ml in both assays	Absence of significant DNA and chromosome damage in human lymphocytes and HepG2 cells. ⁴⁰
<i>Euterpe oleracea</i> pulp-enriched fruit and berry juice (fortified with glucosamine)	<i>S. typhimurium</i> strains: TA98, TA100, TA1535, TA1537. <i>Eschericia coli</i> strain: WP2 (uvrA)	Ames test, with and without metabolic activation	Doses up to 5 µg/plate	Non-genotoxic, with and without metabolic activation. ³⁷
<i>Euterpe oleracea</i> pulp-enriched fruit and berry juice (fortified with glucosamine)	Chinese hamster lung cells	Chromosomal aberration assay, with and without metabolic activation (OECD TG 473)	Concentrations up to 5000 µg/ml	Structural chromosome aberrations not observed with or without metabolic activation. Non-clastogenic. ³⁷
<i>Euterpe oleracea</i> pulp-enriched fruit and berry juice (fortified with glucosamine)	L5178Y/TK+/- mouse lymphoma cells	L5178Y/TK+/- mouse lymphoma assay, with and without metabolic activation (OECD TG 476)	Concentrations up to 500 µg/ml	Non-genotoxic, with and without metabolic activation. ³⁷

Table 10. Genotoxicity Studies on Palm Tree-derived ingredients and Related Components of *Euterpe edulis* and *Euterpe oleracea*.

Ingredient	Strain/cell type	Assay	Dose/Concentration	Results
In Vivo				
<i>Euterpe edulis</i> fruit pulp extract (9% in water)	4 groups of 5 male Wistar rats	Micronucleus assay (OECD TG 474). After dosing period, animals were killed and bone marrow smears prepared. Ratio of polychromatic to normochromatic erythrocytes (PCE/PCE + NCE x 100) calculated based on an evaluation of 2000 erythrocytes per slide (1000 per animal).	4 groups received doses (by gavage) of 22.5, 45, 90, and 180 mg/kg, respectively, for 3 consecutive days.	Significant increase (P < 0.05) in frequency of micronucleated polychromatic erythrocytes in bone marrow, at daily doses of 45 to 180 mg/kg. ⁵
<i>Euterpe edulis</i> fruit pulp extract (9% in water)	4 groups of 5 male Wistar rats	Micronucleus assay. Peripheral blood (500 µl) drawn from rats dosed according to preceding test procedure, and whole blood smears prepared. Frequency of lymphocytes with micronuclei per total lymphocytes determined using sample sized of 1000 lymphocytes per animal	Doses same as in preceding test	No statistically significant positive results for micronucleus frequency observed. Dose-related increase in mitotic index (P > 0.05) detected (at 90 to 180 mg/kg), suggesting induction of proliferation alongside acceptable survival rates of >80%. ⁶
<i>Euterpe edulis</i> fruit pulp extract (9% in water)	4 groups of 5 male Wistar rats	Comet assay (Single cell gel electrophoresis (SCGE) test). Blood drawn from rats dosed according to same test procedure. Slides prepared and extent and distribution of DNA damage evaluated by examining at least 200 randomly selected and non-overlapping cells.	Same doses	The SCGE score did not indicate significant DNA lesions, such as single or double breakages. ⁶
<i>Euterpe edulis</i> fruit pulp (9%)	5 human subjects	Comet assay. Subjects ingested single dose on 5 consecutive days. Peripheral blood drawn and slides prepared. Extent and distribution of DNA damage evaluated by examining at least 200 randomly selected and non-overlapping cells.	Single dose of 300 ml	SCGE score did not indicate significant DNA lesions, such as single or double breakages. No statistically significant positive genotoxicity response identified. ⁶

Table 10. Genotoxicity Studies on Palm Tree-derived ingredients and Related Components of *Euterpe edulis* and *Euterpe oleracea*.

Ingredient	Strain/cell type	Assay	Dose/Concentration	Results
<i>Euterpe oleracea</i> pulp-enriched fruit and berry juice (fortified with glucosamine) in saline	Groups of 16 BALB/c mice (8 males, 8 females) and 12 BALB/c mice (6 males, 6 females)	Micronucleus assay. Group divided into mice dosed orally or intraperitoneally daily for 7 days. Animals then killed, and bone marrow analyzed for micronuclei in polychromatic erythrocytes. Cytogenetic analysis performed by direct method of rinsing marrow of the femur and tibia.	Daily doses of 100µg/150µl	No increase in frequency of micronuclei in bone marrow polychromatic erythrocytes. ³⁷
<i>Euterpe oleracea</i> fruit pulp	Bone marrow cells and peripheral blood polychromatic erythrocytes (male Swiss albino mice)	Micronucleus assay. Assay performed using bone marrow cells and peripheral blood polychromatic erythrocytes. Number of micronucleated polychromatic erythrocytes in 2000 polychromatic erythrocytes per animal recorded.	Single (acute) oral doses (gavage) of 3.33 g/kg, 10 g/kg, and 16.67 g/kg were administered to groups of male Swiss albino mice (number per dose not stated).	No statistically significant differences ($p > 0.05$), between the negative control and groups treated with doses of the test substance, in the frequency of micronucleated polychromatic erythrocytes in bone marrow or blood. No genotoxic effects in this assay. ⁴¹
<i>Euterpe oleracea</i> fruit pulp	Bone marrow cells and peripheral blood polychromatic erythrocytes (male Swiss albino mice)	Micronucleus assay. Assay performed using bone marrow cells and peripheral blood polychromatic erythrocytes. Number of micronucleated polychromatic erythrocytes in 2000 polychromatic erythrocytes per animal recorded.	Oral doses (gavage) of 3.33 g/kg, 10 g/kg, and 16.67 g/kg administered to groups of male Swiss albino mice (number per dose not stated) daily for 14 consecutive days.	No statistically significant differences ($p > 0.05$), between the negative control and groups treated with doses of the test substance, in the frequency of micronucleated polychromatic erythrocytes in bone marrow or blood. No genotoxic effects in this assay. ⁴¹
<i>Euterpe oleracea</i> fruit pulp	Bone marrow cells and peripheral blood polychromatic erythrocytes (male Swiss albino mice)	Comet assay (DNA damage assay). Peripheral blood collected from mice and cellular suspensions prepared. Liver and kidney cells also collected (100 cells in each tissue visually scored)	Swiss albino mice dosed with test substance (same doses in acute and subacute dosing procedures in both micronucleus assays immediately above)	Absence of increased DNA damage (in peripheral blood, liver, and kidney cells) in mice dosed orally (all doses). Non-genotoxic. ⁴¹

Table 10. Genotoxicity Studies on Palm Tree-derived ingredients and Related Components of *Euterpe edulis* and *Euterpe oleracea*.

Ingredient	Strain/cell type	Assay	Dose/Concentration	Results
<i>Euterpe oleracea</i> fruit oil	Groups of 6 Wistar rats	Comet assay. Doses administered by gavage (at 24-h intervals) for 14 consecutive days. At 24 h after last dose, peripheral blood from tail collected. Animals were killed and liver, bone marrow (from femur), and testicle cells also collected. DNA damage evaluated by examining at least 100 randomly selected and non-overlapping cells (50 cells per coded slide) per animal in blind analysis.	Doses of 30, 100, or 300 mg/kg in 1% Tween 80	No significant induction of DNA strand breaks observed in tissues from any dose group. In the few nucleoids with DNA damage (also observed with vehicle control), damage was considered minor. ³⁸
<i>Euterpe oleracea</i> fruit oil	Groups of 6 Wistar rats	Micronucleus assay. Doses and dosing procedure used in preceding test. Slides of bone marrow (femur) smears prepared and 2000 polychromatic Erythrocytes (PCE) per animal scored to determine clastogenic and/or aneugenic property of test substance. Clastogenic/aneugenic damage investigated by analyzing micronuclei formation in bone marrow PCE.	Doses of 30, 100, or 300 mg/kg in 1% Tween 80	No significant increase in the micronucleus frequency in bone marrow cells, as well as no significant difference/increase in the PCE/NCE ratio ($P < 0.05$). ³⁸
