SQUALANE and SQUALENE

CONCLUSION: The Cosmetic Ingredient Review (CIR) Expert Panel (Panel) first published the Final Report on the Safety Assessment of Squalane and Squalene in 1982. The Panel concluded that "both Squalane and Squalene are safe as cosmetic ingredients in the present practices of use and concentration," as described in that report. In 2001, after considering new studies and updated use data on these two ingredients, the Panel determined to not re-open the safety assessment. Data identified in the published literature that have become available since the 2001 re-review was issued, support the conclusion reached by the Panel in the original review. The Panel also reviewed updated information regarding product types and ingredient use frequencies as reported in the US Food and Drug Administration (FDA) Voluntary Cosmetic Registration Program (VCRP) database, and the maximum use concentrations provided by the Personal Care Products Council. The Panel determined to not reopen this safety assessment and reaffirmed the original conclusion that Squalane and Squalene are safe as cosmetic ingredients in the present practices of use and concentration, as given in Table 1.

<u>DISCUSSION</u>: The reported frequency of use has increased significantly for both ingredients since the initial re-review was considered. According to VCRP data, Squalane and Squalene were reported to be used in 595 and 29 formulations, respectively, in 2001.² In 2019, the VCRP indicates that Squalane is used in 2785 formulations, and Squalene is used in 527 formulations.¹⁴ For Squalane, the current maximum concentration of use (96.8%)¹⁴ is the same as that reported in 2001 (97%);² however, the maximum concentrations of use by exposure type (e.g., eye area, nails) have increased for some categories. The opposite is true for Squalene; the maximum concentration of use has decreased since the previous re-review. In 2001, Squalene was used at up to 10%;² data received in 2018 report that the maximum concentration of use is 1.2%.¹⁵

Squalane and Squalene are natural components of human sebum. Although new studies indicated there could be sensitization potential, there is no significant clinical evidence of sensitization. The Panel stated the lack of case reports, in spite of the increased frequency of use, and the Panel's clinical experience with these ingredients support the safety of these ingredients for use in cosmetics.

Table 1. Current and historical frequency and concentration of use of Squalane and Squalene according to duration and exposure

	# of Uses		Max Conc of Use (%)	
	201914	20012	201815	20012
